

HR Technology Enterprise Optimization

Enterprise Optimization has but a single goal – and that is – to improve client HRIS operations!

Designed to strengthen existing operations, HRIS Enterprise Optimization is a process that utilizes best practices in the assessment, evaluation, and design of HRIS solutions. Thus, all key people, processes, and technologies are considered accordingly.

Many organizations have implemented a variety of HRIS products with the expectation that human resource information management would strengthen human resource management operations. After many months of expensive, confusing, and non productive effort, too many organizations complete implementations only to find that productivity and profitability have actually fallen.

HRIS Enterprise Optimization has two objectives.

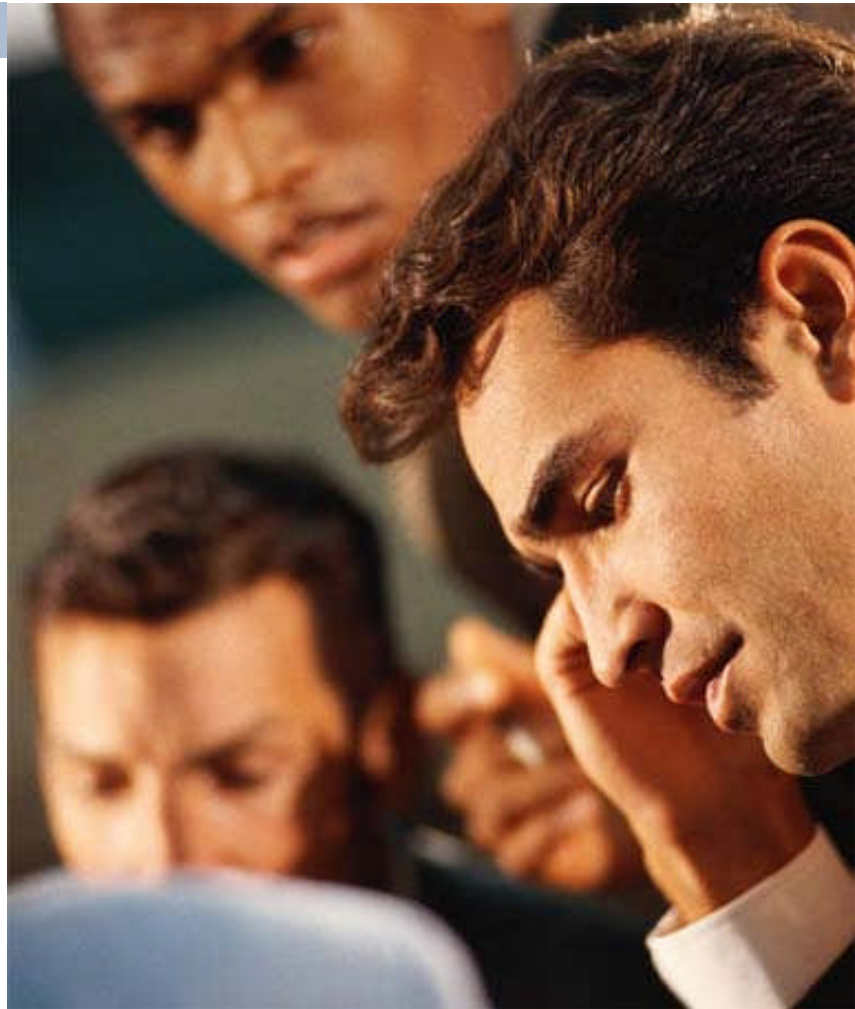

- Restore clients to productive and profitable work.
- Align people, process, and technology to meet long-term corporate goals.

Benefits

An extraordinary value proposition. Extending the operational life of an existing human resource information system has many advantages.

CDG understands the need for rapid and effective change with minimal disruption. Our improvement methodologies are designed accordingly.
